

DEPTH OF FIELD

The image on the left shows the zone of focus or depth of field at $f2.5 - f5.6$.

These apertures display a characteristic shallow or small depth of field. As you can clearly see the area beyond (A) is unfocused, while The post at the point (A) is in sharp focus

The two images above indicate clearly how the zone of focus works in relation to the film plane. As you can see in the two images only point A in each image falls as a point of focus on the film plane while points B and C on the left and D and E on the above right fall either side of the plane of focus.
